this book was first published in 2001 it provides an introduction to fourier analysis and partial differential equations and is intended to be used with courses for beginning graduate students with minimal prerequisites the authors take the reader from fundamentals to research topics in the area of nonlinear evolution equations the first part of the book consists of some very classical material followed by a discussion of the theory of periodic distributions and the periodic sobolev spaces the authors then turn to the study of linear and nonlinear equations in the setting provided by periodic distributions they assume only some familiarity with banach and hilbert spaces and the elementary properties of bounded linear operators after presenting a fairly complete discussion of local and global well posedness for the nonlinear schrödinger and the korteweg de vries equations they turn their attention in the two final chapters to the non periodic setting concentrating on problems that do not occur in the periodic case

now in paperback topology via logic is an advanced textbook on topology for computer scientists based on a course given by the author to postgraduate students of computer science at imperial college it has three unusual features first the introduction is from the locale viewpoint motivated by the logic of finite observations this provides a more direct approach than the traditional one based on abstracting properties of open sets in the real line second the methods of locale theory are freely exploited third there is substantial discussion of some computer science applications although books on topology aimed at mathematics exist no book has been written specifically for computer scientists as computer scientists become more aware of the mathematical foundations of their discipline it is appropriate that such topics are presented in a form of direct relevance and applicability this book goes some way towards bridging the gap
